The Interdisciplinary Neuroscience Program (INP) at George Mason University is grounded in systems biology, biochemistry, bioengineering, and psychology. Research and education within the INP is coordinated under the efforts of faculty participating from a number of colleges across the university.

The INP administers the Neuroscience Minor, Neuroscience BS, and the Neuroscience PhD. Participating neuroscience faculty comprise a unique blend of traditional, experimental, and computational scientists with research spanning the spectrum of key topics in neuroscience including: behavior, anatomy, physiology, neuropharmacology, computational modeling, and informatics. Key research initiatives currently underway within the INP are:

- Plasticity mechanisms underlying neurological development
- Identifying and characterizing protein interactions for the dopamine and nicotinic acetylcholine receptors in the brain
- Biochemical dynamics in disorders of the basal ganglia
- Computational methods for simulation of complex biological systems
- Description and generation of neuronal morphology
- Adaptive control for stabilization of epilepsy
- Role of metals in memory and Alzheimer's disease
- Biochemical/metabolic simulations at the organism level
- Cellular and sub-cellular models of associative learning
- Experimental and computational models in calcium signaling
- Synaptic plasticity

**Faculty**

**Program Faculty**

**Professors**
Ascoli, Barreto, Blackwell, Cebral, Flinn, Houser, Jafri, Klimov, McCabe, Olds, Sander

**Associate Professors**
Dumas, Fryxell, Greenwood, Kabbani, Krueger, McDonald, Peixoto, Peterson, Sikdar, So, Thompson

**Assistant Professors**
Joiner

**Adjunct Faculty**
Lewis

**Programs**
- Neuroscience Minor
- Neuroscience, BS
- Neuroscience, PhD

The INP also co-administers the Neuroethics Concentration in the Interdisciplinary Studies, MAIS and the Neuroscience Concentration in the Biology, MS.
